

TWW Will Install Distribution System Flushing Assemblies to Maintain High Water Quality

DECEMBER 13, 2023

What?

Trenton Water Works (TWW) will install approximately **170 flushing assemblies** on dead end streets starting **January 2** in specific areas of its 683-mile water distribution system to strengthen its system management and maintain high water quality, including adequate chlorine levels for disinfection.

Why?

The flushing assemblies will enable water utility personnel to flush water mains of aged water and sediment at dead-end water mains, improving overall water quality. Once TWW contract vendor Dewcon, Inc. installs all the assemblies, TWW will integrate their operation into a multifaceted distribution system flushing plan executed annually and as needed to maintain high water quality and adequate chlorine levels for disinfection. This critical work is part of TWW's **Legionella** mitigation.

What To Expect at the Tap

TWW has provided an alphabetized list of the installation locations by municipality. **Some locations may change without notice. Customers will not be without water during the installations. However, some customers in installation work areas **may see** brown water at the tap when Dewcon personnel test the assemblies by discharging water from water mains. TWW recommends running a cold water tap for approximately 15 minutes or until the water runs clear. Do not do laundry if you see brown water. Drain and refill your water heater according to the manufacturer's instructions. **Ensure your water heater's temperature is set at or above 120°F to minimize the growth of bacteria, such as Legionella.**
